Canadian Institute for Historical Microreproductions / Institut canadien de microreproductions historiques

© 1997
Technical and Bibliographic Notes / Notes techniques et bibliographiques

The Institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming are checked below.

☑ Coloured covers / Couverture de couleur
☑ Covers damaged / Couverture endommagée
☑ Covers restored and/or laminated / Couverture restaurée et/ou pelliculée
☑ Cover title missing / Le titre de couverture manque
☑ Coloured maps / Cartes géographiques en couleur
☑ Coloured ink (i.e. other than blue or black) / Encre de couleur (i.e. autre que bleue ou noire)
☑ Coloured plates and/or illustrations / Planches et/ou illustrations en couleur
☑ Bound with other material / Relié avec d'autres documents
☑ Only edition available / Seule édition disponible
☑ Tight binding may cause shadows or distortion along interior margin / La reliure serrée peut causer de l'ombre ou de la distorsion le long de la marge intérieure.
☑ Blank leaves added during restorations may appear within the text. Whenever possible, these have been omitted from filming / Il se peut que certaines pages blanches ajoutées lors d'une restauration apparaissent dans le texte, mais, lorsque cela était possible, ces pages n'ont pas été filmées.
☑ Additional comments / Commentaires supplémentaires:

☐ Coloured pages / Pages de couleur
☐ Pages damaged / Pages endommagées
☐ Pages restored and/or laminated / Pages restaurées et/ou pelliculées
☐ Pages discoloured, stained or foxed / Pages décolorées, tachées ou piquées
☐ Pages detached / Pages détachées
☐ Showthrough / Transparence
☐ Quality of print varies / Qualité inégale de l'impression
☐ Includes supplementary material / Comprend du matériel supplémentaire
☐ Pages wholly or partially obscured by errata slips, tissues, etc., have been refilmed to ensure the best possible image / Les pages totalement ou partiellement obscurcies par un feuillet d'errata, une pelure, etc., ont été filmées à nouveau de façon à obtenir la meilleure image possible.
☐ Opposing pages with varying colouration or discolourations are filmed twice to ensure the best possible image / Les pages s'opposant ayant des colorations variables ou des décolorations sont filmées deux fois afin d'obtenir la meilleure image possible.

This item is filmed at the reduction ratio checked below / Ce document est filmé au taux de réduction indiqué ci-dessous.

The copy filmed here has been reproduced thanks to the generosity of:

National Library of Canada

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

The last recorded frame on each microfiche shall contain the symbol —— (meaning "CONTINUED"), or the symbol ▼ (meaning "END"), whichever applies.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left hand corner, left to right end top to bottom, as many frames as required. The following diagrams illustrate the method:
L'exemple filmé et reproduit grâce à la générosité de:

Bibliothèque nationale du Canada

Les images suivantes ont été reproduites avec le plus grand soin, compte tenu de la condition et de la netteté de l'exemple filmé, et en conformité avec les conditions du contrat de filmage.

Les exemplaires originaux dont la couverture en papier est imprimée sont filmés en commençant par le premier plat et en terminant soit par la dernière page qui comporte une empreinte d'impression ou d'illustration, soit par le second plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par la première page qui comporte une empreinte d'impression ou d'illustration et en terminant par la dernière page qui comporte une telle empreinte.

Un des symboles suivants apparaîtra sur la dernière image de chaque microfiche, selon le cas: le symbole ← signifie "A SUIVRE", le symbole ▼ signifie "FIN".

Les certes, planches, tableaux, etc., peuvent être filmés à des teux de réduction différents. Lorsque le document est trop grand pour être reproduit en un seul cliché, il est filmé à partir de l'angle supérieur gauche, de gauche à droite, et de haut en bas, en prenant le nombre d'images nécessaire. Les diagrammes suivants illustrent le méthode.

AN INVESTIGATION
INTO THE QUESTION OF EARLY
PUTREFACTION OF
EVISCERATED FISH IN WHICH
THE GILLS HAVE BEEN LEFT

BY

LOUIS GROSS, M.D.
Douglas Fellow in Pathology, McGill University.

(From the Laboratories of the Atlantic Biological Station
and the Pathological Laboratories of the
Royal Victoria Hospital and of
McGill University)

Published by the authority of the Sub-Committee of the Privy
Council for Scientific and Industrial Research

OTTAWA, 1919
AN INVESTIGATION INTO THE QUESTION OF EARLY PUTREFACTION OF EVISCERATED FISH IN WHICH THE GILLS HAVE BEEN LEFT.

It is claimed by many fish dealers that eviscerated fish in which the gills have not been taken out putrefy more rapidly than those in which the gills are removed.

In order to determine whether there is a real foundation for this belief, several specimens of pollock and hake were eviscerated; in some the gills were allowed to remain, in others they were removed.

These fish were then exposed to the air in a fairly warm room. The removed gills were also exposed to the air.

In forty-eight hours a strongly putrefactive odour came from the fish. This appeared to be somewhat more marked from the fish in which the gills were left.

The removed gills which were exposed to the air had led and showed no evidence of putrefaction.

It seemed, therefore, that the moist gills left in the fish were the seat of fairly active putrefaction.

It remained now to determine the reason for this active putrefaction of eviscerated fish in which the gills are left.

An investigation into the method of eviscerating fish by the fishermen showed that the viscera are carelessly removed by hand, the intestinal contents are smeared over the gills and the fish left for hours without proper cleaning before the dealers receive them.

The question whether the native flora of the gills is more putrefactive than that commonly found on the rest of the fish became unimportant, because the methods of the fishermen quickly insured a rich contamination of every part of the fish with diverse flora.

The problem seemed then to resolve itself into a question of culture medium.

Since every part of the fish was abundantly inoculated with similar bacteria, was the earlier and more extensive putrefaction of the gills due to the fact that gills form unusually good culture
medium for the bacteria? Was it due to the fact that the bloodiness of the gills was conducive to more rapid growth?

To determine this, three sets of media were made:

(a) Fish meat medium (agar and broth).
(b) Gill medium (agar and broth).
(c) Blood medium (agar and broth).

The following was the method of preparation:

500 gms. of minced fish meat was placed in a pot.

500 cc. of distilled water into which was dissolved 26.5 gms. of sodium chloride, 0.75 gms. of potassium chloride and 3.25 gms. of magnesium chloride, were added to the minced fish meat. The whole was placed in a water bath and gently heated to 40°C for about 20 minutes. The temperature was now suddenly raised to boiling and kept thus for 10 minutes.

This mixture was next strained through butter muslin. Five grams of peptone were now stirred into the fish water and the whole heated at 100°C. for twenty minutes.

The mixture was again filtered and made up to the original 506 cc.

250 cc. of this medium was diluted with an equal volume of distilled water and tubed as fish meat broth.

To the other 250 cc., 4 gms. of agar were added and the mass tubed as fish meat agar for plating.

Another set of media was made in the same way with the exception that minced fish gills were substituted for fish meat. This constituted gill broth and gill agar.

Finally, another set of media in which fish blood was used instead of meat constituted blood broth and blood agar.

Thus three sets of media were prepared in exactly the same way and different from one another only in the fact that in the first fish meat was used; in the second fish gills (together with their blood); in the third set fish blood. (Haddock was used in the preparation of these media).

As the same quantities of ingredients were used in each set it was thought reasonable to suppose that the relative cultural values of the various media would resemble those of these tissues in their native state.

* The method is described in R. B. Seto’s Bacteriological Technique, W.B. Saunders Co. 1916 p. 100.
Four strains of bacteria in pure culture from different parts of fish were obtained from Miss Eleanor Shanly. These we shall call for convenience sake \( \alpha, \beta, \gamma, \) and \( \delta \) *.

In order to compare the relative cultural values of the media each set was plated with the four strains of bacteria. In each case the dilutions were made on the broth of the set. Thus \( \alpha \) was diluted in fish meat broth and plated in fish meat agar. Similarly with \( \beta, \gamma \) and \( \delta \).*

Next, bacterium \( \alpha \) was diluted in gill broth and plated in gill agar. This was also done with \( \beta, \gamma \) and \( \delta \).*

It was then repeated with blood, broth and agar.

The object of plating was to compare the rate of growth of colonies originating from single bacteria in the different media.

Since the technique in plating was carried out with the greatest care, since four different bacteria were used, and as the whole experiment was done in duplicate, it was felt that the rate of appearance of colonies on the plate as well as the size and number of these colonies could be safely interpreted as showing the relative values of the media for cultural purposes.

The observations on the first series of plates after seventy-two hours of cultivation at room temperature are recorded in Table A.

<table>
<thead>
<tr>
<th>Bacterium</th>
<th>Fish Meat</th>
<th>Gill</th>
<th>Blood</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alpha</td>
<td>Numerous colonies, Medium size.</td>
<td>Numerous colonies, Medium size.</td>
<td>Numerous colonies, Medium size.</td>
</tr>
<tr>
<td>Beta</td>
<td>Very few colonies, small size.</td>
<td>Large number of colonies, Medium size.</td>
<td>Large number of colonies, Medium size.</td>
</tr>
<tr>
<td>Gamma</td>
<td>No visible growth.</td>
<td>Very numerous colonies, Medium size.</td>
<td>Large number of colonies, Medium size.</td>
</tr>
<tr>
<td>Delta</td>
<td>No growth.</td>
<td>No visible growth.</td>
<td>Fair number of colonies, Medium size.</td>
</tr>
</tbody>
</table>

* See Miss Shanly's report on the intestinal flora of the Sardine Herring, for 1919.

\( \alpha \) corresponds to the gill.
\( \beta \) corresponds to the fish intestine.
\( \gamma \) corresponds to the fish liver.
\( \delta \) corresponds to the fish stomach.
Table B represents the results of a duplicate series of plates, i.e. using the same bacteria and the same media.

<table>
<thead>

</tbody>
</table>

From the above it will be seen that bacterium a is the only one that grows with equal facility on the three media. Bacteria $\beta$ and $\gamma$ shows a distinct preference for gill and blood media.

$\gamma$ shows a particularly good growth on gill medium.

$\delta$ appears to grow best on blood medium.

After four days tiny colonies appeared on all the fish meat plates showing that these were not sterile, but that the rate of growth was slower on this medium than on the others.

Thus it is seen that of four bacteria, common around in fish, three show a distinct preference for gills and blood as culture media, and as gills are usually covered with blood and bacteria after the incomplete evisceration that is now in common practice among the fishermen, it is probable that these, i.e., gills and blood, become the seat of an early luxuriant growth of putrefactive organisms.

Guided by these observations it is desirable to recommend the removal of the gills and a thorough washing of the eviscerated fish in order to prevent, at least to some degree, early putrefaction.
